**Aesthetic characteristics**

Contemporary proposals for classical environments: the walnut finish fronts combined with aluminium bar handles prove that noble woods can live in harmony with the more innovative designs and materials

We present a large sized kitchen in a privileged environment. This project is an ideal solution for a house with these characteristics.

Architecture

The work area is concentrated in two islands which are the indisputable stars of this kitchen. One of the islands is dedicated to cooking and food preparation tasks and the other to washing tasks. In both, the drawers are equipped with a great variety of solutions developed by Santos, that allow everything to be nearby and in order.

The tall units, all in white, could at first pass unnoticed even with their 6m long front. Behind the one piece sliding doors we discover the stunning beauty and functionality that is hidden in the interior. The interior accessories of the tall units are very important to get the most functionality out of the units and increase their capacity. There are many possibilities as you can choose between: wooden grill shelves or wooden grill shelves and wooden drawers, container boxes, stainless steel baskets etc.

Two of the units are equipped with wooden solid beech grill shelves, reversible with an optional glass surface so as to store objects with a small base. The other two, apart from the wooden grill shelves, offer an additional work area which includes plugs for small appliances and a lighting system which permit the use of small appliances without the need to move them.

Highlights

A kitchen of great proportions in which there is also a dining area. The intention has been to give the kitchen a classical air without losing any of its functionality. It is a place where all the family can get together to share a meal and much more. It is a well organized kitchen but above all a kitchen for living.

Sink unit with waste bins in lower drawer

Adapt the design to our needs.

There have been many campaigns to make us aware of the importance of separating waste at home so that we can then place it in the right recycling bin. It is fundamental to place only the corresponding waste in each bin if we want the recycling to be efficient.

To make this an easy task Santos has put a great deal of effort into developing solutions that help us optimize spaces and contribute to caring for our environment. The position of the bins depends on the size and the location of the units and the electrical appliances.

The parts of the sink unit most likely to come into contact with water are made of laminated marine board, a material that is highly resistant to humidity.

In this case the upper drawer has been reserved for storing and organising cleaning utensils. The lower drawer is equipped with waste bins (4 bins that hold 17 litres each).

Sink unit with waste bins in upper drawer

In this case the upper drawer has been equipped with waste bins (two 17 litre bins + two small 8 litre bins) and various compartments for cleaning utensils. The lower drawer is isolated and permits the storage of food and other day-to-day objects used in the kitchen.

Coplanar sliding door system

The coplanar sliding door system allows doors to open fully, providing greater visibility and easier access to the interior of the unit. Once they are closed, they line up perfectly, helping to achieve an optimum aesthetic appearance.

The interior of the unit offers a high storage area with wooden grill shelves.

It also includes an additional work area which includes plugs and a lighting system that permits the use of small appliances without the need to move them.

The lower area of the unit is completed with wooden drawers which help keep things tidy and enable the storage of food and other objects that are used daily basis in the kitchen.

The interior is equipped with wooden grill shelves made of beech wood and storage boxes with ventilation for keeping food fresh for longer.
