## Aesthetic characteristics

From some years back the concept of the kitchen has changed. It has evolved from a place to cook into a meeting place where people come together. As a result, it is not surprising that new proposals have appeared to take into account this new concept of the kitchen as the heart of the home. The kitchen opens up to other spaces in the home. It's linked to the dining room, the sitting room or the terrace.

The influence to the culture of wellness is perceptible. There is a greater need to harmonise our home, eliminating everything that is not necessary. The plain front, without any decoration, transmits serenity and equilibrium. There is nothing that disturbs our view. The glass fronts are a perfect complement. The smoothness of its edges and its cold elegance reinforce the brightness of the white colour.

## Architecture

U Kitchen with 3 work areas:

The washing area is situated underneath the window and integrates the sink and dishwasher.

The cooking area is equipped with large capacity drawers to store pots, household goods and food. The wall units reach the ceiling to make the most of the available space and to help achieve a homely environment.

The tall units are used mainly to integrate the electrical appliances.

## Highlights

Spacious, practical, actual and designed to make working comfortable. A kitchen full of light and good solutions.

It's interesting to see how the space dedicated to the kitchen, which is normally one of the most important places of the house, has been reduced in the house plans. In our dream house this situation would no doubt change.

The choice of the colours, the materials and the distribution of the space have given a greater role to the natural light coming in. A bright and luminous kitchen is synonymous with a homely kitchen. The feeling of spaciousness is surprising in this kitchen.

### Aesthetics: 2 levels. Functionality: 3 levels

A horizontal projection avoids doors in the lower area and encourages the use of drawers. This system provides a panoramic view of what is inside the drawers and makes access easier, thereby making it more comfortable to cook and clean.

To obtain the maximum functionality but without forgetting the aesthetic design, the base units in the cooking area have been equipped with two drawers. The first hides an interior drawer which makes the most of the interior space in a versatile and organised way without affecting the aesthetics of the kitchen. At a glance, two levels but really 3 functional levels.

### Units to the ceiling: Tall units

To optimize the kitchen's capacity the kitchen includes an area of tall units which, apart from achieving more storage room, contains many electrical appliances in a reduced space.

To the ceiling units is one way of making the most of all the space available. The modules on top of the tall units have the Mechanic Assisted Opening System incorporated in the door (SAA-M), which is more comfortable when the units are over a certain height.
